

ACSM precision rail guides with innovative cage guidance system

ACSM—Consistent refinement of the SKF patent

Back in 1994, SKF was the first bearing supplier to develop a monolithic ACS cage guidance system (Anti Creeping System), to effectively prevent cage creep. This solution has been copied by numerous competitors ever since. Now SKF has consistently refined its own ACS solution into the Anti Creeping System Module (ACSM).

The new ACSM features

Module gearing with involute gear wheel

Low friction and a high contact ratio are characteristic features of the involute gearing principle. Since SKF attaches the greatest importance to supreme precision, running accuracy and reliability of all its products, this type of gear wheel is used for the ACSM.

Only the best goes into our standard products: Corrosion-resistant steel

The semiconductor and food industries as well as the chemical and medical engineering sectors are advancing rapidly. This goes hand in hand with ever increasing demands on the materials and equipment used. The ACSM takes this development into account. Its rails and rolling elements are manufactured from corrosion-resistant steel. In response to frequent customer requests, the gear is now made of high-grade brass as standard.

Materials

Rail: Corrosion-resistant steel X46 Cr13
Rollers: Bearing steel 100 Cr6
Cage: POM
Gear: Brass CuZn39Pb3

Guided precision now also available in size 2

In order to meet the increasing market demands for miniaturisation, the ACSM series was extended by size 2 rail guides.

Unlimited freedom

New manufacturing methods have enabled further improvements in the rail geometry to be achieved. The groove bottom in the raceway prism has been eliminated and the end face holes at the rail modules are no longer required. This results in higher system stiffness. Moreover, the gearing runs over the entire rail length continuously so that the “specified stroke” information, needed for the classic ACS, is rendered superfluous. In this way, customers are not restricted in their freedom when operating the precision rail guides.

Optimized geometry without groove bottom and end face hole

Continuous gearing

Unique solution for the accommodation of combined loads

As is the case with the ACS, the ACSM sizes 3, 6 and 9 are equipped with a segmented cage. This permits individual turning of the rolling elements by 90° along the longitudinal axis in order to adjust them to the load situation and load direction. In this way, the ACSM precision rail guides can be optimally adjusted to customer-specific requirements.

Individual adjustment of rolling elements

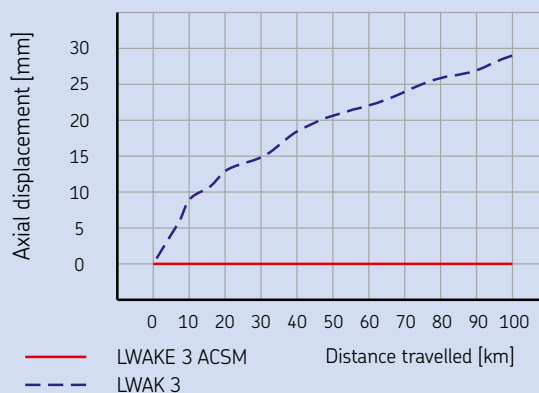

Advantages of the ACSM

High acceleration, vertical installation and collective loads with uneven preload or uneven load distribution are the primary causes for cage creep. The ACSM prevents the cage from wandering out of its correct position and thus increases the reliability and availability of machines and equipment.

The advantages at a glance:

- Significantly higher acceleration possible
- Vertical installation and uneven load distribution possible
- Higher accuracy through defined cage positioning
- Compatible with other SKF precision rail guides due to identical size and dimensions
- Low maintenance requirements and optimised availability of equipment

Tested quality

Test parameters

LWE 3150 compared to LWRE 3150 ACS
 Double strokes: 27 million
 Centric load: 1 000 N
 Acceleration: 16 g
 Speed: 3.2 m/s

Comparison of stiffness and stress

The improved gearing geometry thanks to modified manufacturing technology results in lower peak loads in the material. This leads to higher system stiffness

and absolute accuracy of the ACSM precision rail guides. Stress on the material is lower and the life expectancy is increased.

The Power of Knowledge Engineering

Drawing on five areas of competence and application-specific expertise amassed over more than 100 years, SKF brings innovative solutions to OEMs and production facilities in every major industry worldwide. These five competence areas include bearings and units, seals, lubrication systems, mechatronics (combining mechanics and electronics into intelligent systems), and a wide range of services, from 3-D computer modelling to advanced condition monitoring and reliability and asset management systems. A global presence provides SKF customers uniform quality standards and worldwide product availability.
